High Risk Accounts

Top 10 accounts to be on the lookout for

How many transactions between 1 and 4 am are flagged as suspicious

Four flags were created to identify customers who were transacting at suspicious velocities, during suspicious hours , customers who were transacting amounts that were higher than their normal average plus 3 times the standard deviation of the amount they usually transact, and customers who were making transactions from countries where they did not register in. Therefore for one to be flagged as a suspicious customer, they had to meet three or four of the flagged conditions. With all these conditions I identified 26 high risks accounts, who had made 728 transactions in total worth 24.35 million dollars

Total flagged transactions taking place at suspicious hours

Sum of total_value and Sum of total_volume by month_name

Most suspicious transactions take place between 2 am and 3 am with the leading merchants used by the accounts that are making the suspicious transactions being mobile banking and web banking. Transactions made in the period of January to September saw a spike of both transactions value and volume.

The table shows transactional risk by correlating fraud flags, risk rankings, and historical behavioral anomalies across our customer base. It identifies suspicious patterns such as transactions during unusual hours, high-velocity activity, and spending that exceeds three standard deviations from a user's normal average. By aggregating these metrics, the table quantifies a total average financial exposure of over 521,000, allowing for a prioritized response to potential fraud. Ultimately, this data-driven approach segments customers into risk groups to streamline the identification of unregistered geographic activity and high-value outliers.
